Dear Hiring Manager,

I am writing to express my interest in joining your team as a software, cloud or AI engineer, or in a software testing and quality role. I build cloud and DevOps pipelines, AI-powered software, and the quality systems that keep both reliable. My background gives me an unusual advantage: before I wrote production code, I spent years in health, safety and quality management, where my job was to ask what could go wrong before it did. I bring that same habit to every system I build.

I currently work as a Full Stack Developer at DIXKOX Inc., where I design, build and deliver applications end to end using Python, Java, FastAPI, Flask, Next.js, React and TypeScript. I hold a Master of Science in Software Engineering from Quantic School of Business and Technology (October 2026) and an Ontario College Graduate Certificate in Software and Information Systems Testing from Fanshawe College. Along the way I have completed 62 Quantic certifications, 16 Fanshawe projects and 12 hands-on testing and security labs.

What I can bring to your team:

- **Cloud and DevOps:** CI/CD pipelines and deployment automation with Jenkins, GitHub Actions and Docker on AWS and Azure.
- **AI engineering:** generative AI, retrieval-augmented generation (RAG), AI agents and LLM integrations built into real products.
- **Testing and quality:** test strategy and automation with Selenium WebDriver, TestNG, Cucumber, Appium and JMeter, plus clear release-readiness criteria.
- **Security:** threat modelling and protection against common web vulnerabilities such as XSS, CSRF and path traversal, built into delivery rather than added at the end.

As Systems and Quality Engineering Lead at Dopkamid Nigeria Limited since 2020, I have led functional, integration, system and user acceptance testing, set the standards a release must meet before going live, and traced production incidents to their root cause with developers and vendors. In one case, accounting software kept failing about three times a week; instead of repeating the usual quick fix, I tested the machines methodically and found a fluctuating power supply was the real cause. Replacing it ended the repeated downtime. That is how I approach problems: patiently, with evidence, until they stay fixed.

I would welcome the opportunity to discuss how my mix of engineering skill and risk awareness can support your goals. You can see my projects, certifications and full résumé at **frank.dixkox.online**. Thank you for your time and consideration.

Sincerely,
Tinubu Damilola Frank
